• INTRODUCTION

This project focuses on automating the classification of resumes using Generative AI. In recruitment processes, screening thousands of resumes manually is time-consuming and inefficient. By leveraging a zero-shot classification approach using a pre-trained Large Language Model (LLM) from Hugging Face, we classify resumes into relevant job roles without the need for traditional machine learning training.

• OBJECTIVE

To build a GenAI-powered system that automatically classifies resumes into categories such as Data Science, HR, Software Engineering, etc., using zero-shot inference. The aim is to eliminate the need for model training and achieve intelligent classification through natural language understanding.

• TOOLS & TECHNOLOGIES USED

Platform: Google Colab

Programming Language: Python

Libraries:

- transformers (Hugging Face)
- pandas
- re (Regular expressions)
- o tqdm

Model Used: facebook/bart-large-mnli (Zero-shot classification)

Data Source: Resume dataset in CSV format

METHODOLOGY /WORKING

The project follows these steps:

- 1. **Data Upload:** Upload a CSV file containing resumes.
- 2. **Data Cleaning:** Clean the resume text by removing punctuation, lowercasing, and trimming whitespace.
- 3. **Zero-shot Model Setup:** Load the pre-trained BART LLM from Hugging Face's model hub.
- 4. **Category Definition:** Provide the model with predefined job role labels.
- 5. **Classification:** For each resume, ask the model to predict the most relevant job role using zero-shot classification.
- 6. Output: Store and download the predicted results in a new CSV file.

• CODE SNIPPETS WITH EXPLANATION

Step 1: Upload the Resume File

from google.colab import files

uploaded = files.upload()

This code opens a file chooser in Colab so we can upload the csv file directly from the device.

Step 2: Install Transformers Library

!pip install transformers

Installs the transformers package from Hugging Face, which provides access to pretrained LLMs like BART.

Step 3: Import Required Libraries

```
import pandas as pd
import re
from transformers import pipeline
from tqdm import tqdm
```

- Pandas is used for data handling
- re for text cleaning using regex
- Pipeline from transformers loads the GenAI model
- tqdm shows progress bar while looping through resumes

Step 4: Load the Resume Dataset

```
df = pd.read_csv("Resume.csv")
df.columns = df.columns.str.strip()
```

Loads the uploaded resume file into a DataFrame and removes unwanted whitespace in column names

Step 5: Clean the Resume Text

```
def clean_text(text):
    if pd.isnull(text):
    return ""

text = str(text).lower()

text = re.sub(r'\s+', '', text)
```

```
text = re.sub(r'[^\w\s]', ", text)
return text.strip()
df['CleanResume'] = df['Resume str'].apply(clean text)
```

Cleans the resume content by:

- Converting to lowercase
- Removing extra spaces
- Removing punctuation
 Creates a new column called CleanResume with cleaned text.

Step 6: Load the Zero-Shot Classification Model

classifier = pipeline("zero-shot-classification", model="facebook/bart-large-mnli")

Initializes a zero-shot classifier using Hugging Face's facebook/bart-large-mnli model. This model can classify text into categories without training.

Step 7: Define Job Role Categories

```
candidate_labels = ["Data Science", "HR", "DevOps", "Testing", "Design",
"Software Engineer", "Business Analyst"]
```

These are the job categories you want the model to choose from when classifying resumes. You can customize this list based on your project.

Step 8: Predict the Resume Category using GenAI

```
predicted_labels = []
```

for resume in tqdm(df['CleanResume'].head(100)): # Use full data if system is fast

```
if not resume.strip():
predicted_labels.append("Unknown")
continue
result = classifier(resume, candidate_labels)
predicted_labels.append(result['labels'][0])
```

For each cleaned resume:

- It asks the GenAI model to choose the best-fitting label from candidate_labels.
- The top predicted label is saved to predicted_labels list. Uses tqdm to show progress in Colab.

Step 9: Save Predictions to a New File

```
df['PredictedCategory_GenAI'] = predicted_labels
df.to_csv("GenAI_Classified_Resumes.csv", index=False)
from google.colab import files
files.download("GenAI_Classified_Resumes.csv")
```

- Adds a new column to the DataFrame with the predicted category
- Saves the updated DataFrame to a new CSV
- Triggers a download so you can save the results to your system

• SCREENSHOTS/OUTPUT

```
[ ] from google.colab import files
          # Upload Resume.csv from your computer
          uploaded = files.upload()
 ₹
            Choose Files Resume.csv
               Resume.csv(text/csv) - 56273235 bytes, last modified: 7/8/2025 - 100% done
          Saving Resume.csv to Resume.csv

• LINKS FOR THE PROJECT

Google colab link:

co resume screen genai.ipynb

• CHALLENGES FACED & SOLUTIONS

1. Challenge: Low accuracy when using small data samples or ML models

Solution: Switched to full dataset + later replaced with GenAI model

2.Challenge: OpenAI GPT-3.5 API required payment/quota

Solution: Used Hugging Face's free BART-based zero-shot classifier

3.Challenge: Long resume text took time to process

Solution: Limited classification to 100 rows during testing; can scale up later

• CONCLUSION

The project successfully demonstrates how **Generative AI**, specifically a pre-trained **zero-shot classification model** (**facebook/bart-large-mnli**) from Hugging Face, can be used to automate the classification of resumes into predefined job categories. Unlike traditional machine learning approaches, this model required **no manual training** and was capable of understanding and assigning labels purely based on semantic content in the resume.

The implementation:

Eliminated the need for labeled training data
Handled textual variations intelligently
Achieved classification with good accuracy and interpretability
This approach proves highly scalable, customizable, and well-suited for real-world HR and resume screening applications in the **era of Generative**AI.
